

During the installation, you will certainly face some particular cases:

- **“Warm” rooms** with higher temperatures (fireplaces, kitchen hoods...)

In such circumstances, please note that using the profile **C10** and **C11** is recommended (see pricelist). They are thicker and bimaterial, allowing a better hang and a higher stability in such cases.

- **Humid rooms** (bathrooms, spas, swimming pools...); keep an eye on the ventilation system and provide an air access if needed.

CLIPSO does not recommend the fitting of fabrics inside hammams or saunas.

**For all your particular projects, do not hesitate to contact your sales representative which will assist you on selecting the best solution for your project.**

Regarding the fitting of CLIPSO fabrics on your walls, except for the profiles (CCA, CC, C6 or other framing profiles), the process remain the same as for a ceiling.

**Tip: fit the soundproof padding ref. LA-53 between the wall and the fabric, or any other insulation padding.**

- it brings an extra protection between the wall and the fabric
- it allows to erase the asperities of the wall
- it enhances the acoustic and insulating properties of the room
- the touch will be softer

## Specific cases and fitting fabric on walls
